Social Network Analysis using BIGDATA

Dr. Sowmya Naik P T, Dr. Manjunath R, Dr. K.N. Narasimha Murthy³, Ambika P.R⁴

Professor, Dept. of CSE., RR Institute of Technology, Visveswaraya Technological University, Bangalore, India

Professor, Dept. of CSE., City Engineering College, Visveswaraya Technological University, Bangalore, India

Professor, Dept. of CSE., Christ University, Bangalore, India

Assistant Professor, Dept. of CSE., City Engineering College, Visveswaraya Technological University,
Bangalore, India

ABSTRACT: BigData refers to “A Growing Torrent”- the massive amounts and varieties of information, particularly in unstructured form being generated by websites, sensors, social media and others. Big Data recently has become a new ubiquitous term to describe large datasets. The main challenge in handling BigData lies in capturing data, providing a proper representation, managing and analysing data to extract meaningful information in the given domain in a fast and efficient manner. Effective management and analysis of Big Data would bring great benefits and unique opportunities to the users. Big data analytics is a technology-enabled strategy for gaining richer, deeper, and more accurate insights into customers, partners and the business and ultimately gaining competitive advantage. By processing a steady stream of real-time data, organizations can make time-sensitive decisions faster than ever before, monitor emerging trends, course-correct rapidly and jump on new business opportunities. In this paper, we present a brief history of BigData and a life cycle of BigData process model. In this paper, we have investigated many data analytics methods and finally we introduced the *Next Generation Analytics*.

KEYWORDS: Bigdata, Bigdata analytics, Social network analysis.

I. INTRODUCTION

“Big Data” is a term encompassing the use of techniques to capture, process, analyze and visualize potentially large datasets in a reasonable timeframe not accessible to standard IT technologies. By extension, the platform, tools and software used for this purpose are collectively called “Big Data technologies”. Big data research is a vast field that connects with many enabling technologies. The new approach redefines the way data is managed and analyzed by leveraging the power of a distributed grid of computing resources. New technologies are emerging to make unstructured data analytics possible and cost-efficient.

1.1 CHARACTERISTICS OF BIGDATA

In this section, BigData characteristics are described using 3v's (Volume, Variety, Velocity) concept.

Volume: Big data implies enormous volumes of data. It used to be employees created data. Now that data is generated by machines, networks, sensors and human interaction on systems like social media the volume of data to be analyzed is massive.

Variety: Variety refers to many types of data both structured and unstructured. We used to store data from sources like spreadsheets and databases. Now data comes in the form of emails, photos, videos, monitoring devices, PDFs, audio, etc. This variety of unstructured data creates problems for storage, mining and analyzing data.

Velocity: Big Data Velocity deals with the pace at which data flows in from sources like business processes, machines, networks and human interaction with things like social media sites, mobile devices, etc. The flow of data is massive and continuous.

OPTIMUM SOLUTION FOR EFFECTIVE MEDICAL WASTE MANAGEMENT

Jyothi. P¹, Vatsala G.A², Radha Gupta³

¹Professor & HOD, Dept. of Mathematics, City Engineering College, Bangalore, Karnataka, INDIA

²Associate Professor, Dept. of Mathematics, DSATM, Karnataka, Bangalore, INDIA

³Professor & HOD, Dept. of Mathematics, Dayananda Sagar college of Engineering, Bangalore, Karnataka, INDIA

Abstract- Medical wastes are highly hazardous and it lead people under risk of incurable diseases. Medical waste management is very important as medical wastes are increasing day by day. During Health care activities like treating, diagnosing, immunizing human being and animal & while during research activities wastes are generated. Mainly hospitals, clinics, diagnosis centres, healthcare institutions, dental offices, medical laboratories generate medical wastes. This paper deals with application of GP technique which is one of the optimization technique to control the expenditure of medical waste management by considering various factors like segregation, storage, transportation, treatment, by-products after recycling. This paper also helps to the systematic disposal of medical waste and environmental protection.

Keywords: By-products, Goal programming, Optimization, Overachievement, Underachievement

1. INTRODUCTION

Clinical squanders can be named general waste, pathological waste, sharps, Infectious squanders, compound squanders and Radio-active squanders, pharmaceutical squanders, pressurized compartments, Genotoxic squanders and so forth. Risk wastes are sharps, chemical, pathological, pressurized container, infectious, pharmaceutical, Genotoxic wastes etc. Medical Wastes are generated by Government hospital, private hospitals, nursing homes, physician's office, Dental office, Dispensaries, mortuaries, blood bank and collection Centre, Animal houses, Laboratories, Research organizations. Categories of humans exposed to chance of contamination are sanitation employees, scientific and paramedical workforce, sufferers and site visitors. Standard Operating procedures of the system are Generation, segregation, collection, storage, transportation, treatment of wastes. Non-hazardous and hazardous wastes are generated in the hospitals/public authority. Non-hazardous wastes are generated in the sit of office, kitchen, administration, hostels, stores, restrooms etc. Hazardous wastes are generated by wards, treatment rooms, ICU, labor room, dressing room, dialysis room, CT scan in hospital itself.

WHO estimates 85% of hospital wastes are non-hazardous and 10% is infectious, 5% are non-infectious. In health care there are two type of wastes. First variety is Non risk wastes (75%-90%) & the other variety is Risk wastes (10%-25%). Developed countries produce 1-5 kg/bed/day/with variation among countries. In India 1-2kg/bed/day with variation among government and private establishments. Estimated 506.74tons/day wastes generated, out of which 57%wastes undergoes proper disposal. Medical waste handling involves some best practices. To avoid most medical waste problems Health care workers must adhere a few key best practices. Workers should mindful of the laws, they classify and separate all loss by type into the right shading coded squander holders. Isolated squanders should be marked relying upon its classification and the correct documentation ought to go with all holders during travel. Utilize the clinical garbage removal shading code. Recruit the correct garbage removal organization

2. Review of the literature

Details of hazardous management is explained in [1]. [2] Gives the explanation of medical waste management and control. Case study of medical waste management of Korea is explained detail in [3]. Detailed process and Device for the disposal of medical waste is given in [4]. Detailed study of GP model for Rubber Wood manufacturing factory in Tripura is mentioned in [5]. GP approach for food product distribution of small and medium enterprises is mentioned in [6]. [7] Gives the explanation of how to use analytic network process and goal programming for interdependent information system project selection. [8] Explains the process of development of model based on Linear Programming to solve resource allocation task with emphasis on financial aspects.

3. Objectives of the study

- Distinguishing deviation in the objectives
- Boosting the benefit of reused item
- Environmental assurance by compelling the executives of clinical garbage removal

ICETMT-22

Binding interaction between 4-Hydroxy-3-nitrocoumarin and metal ions-A spectroscopic approach

^aG. Nagasree , ^bGeethanjali. H.S, ^cNagaraja.D*

^a*Department of Physics, City Engineering College, Bangalore, India.*

^b*Department of Physics, Bangalore Institute of Technology, Bangalore, India,*

^c*Department of Physics, Bangalore Institute of Technology, Bangalore, India.*

Abstract

Metal ions play vital role in many biochemical and physiological functions when they are in very low concentrations and become lethal if certain limit is exceeded. Their detection even at very low concentration is very much essential. In this work we report the detection of metal ions Cu⁺⁺ and Ni⁺⁺ being members of environment pollutants using a coumarin derivative 4-Hydroxy-3-nitrocoumarin by absorption and emission spectroscopic methods. It is noticed that the metal ions are capable of reducing the absorbance (OD) and emission intensity of the coumarin derivative dissolved in Toluene, Dichloromethane and 1,2-Dichloroethane even at very low concentration of 10⁻³ M. The sample concentration is maintained at 10⁻⁵M. The OD is reduced with the increase in metal ion concentration without shift in absorption peak of 272nm. Emission intensity is also quenched by them without shifting the emission peak which is located at 555nm. The spectroscopic data is analyzed using Benesi-Hildebrand. Binding constant values are calculated using both absorption and emission data. The values are found to be towards higher side. Gibb's free energy change which is an indication of spontaneity/non- spontaneity of compound-Metal ion binding is also evaluated. Gibb's free energy suggests that the studied compound has more affinity towards metal ions and can selectively sense them.

Key words: Metal ions, coumarin, Absorption and emission spectroscopy, binding constant, BH plots

Optimisation of sub-space clustering in a high dimension data using Laplacian graph and machine learning

P.R. Ambika and A. Bharathi Malakreddy

Abstract

There are many applications like business analytics, computer vision and medical data analytics, where an unsupervised approach of learning is used for the high-dimension data (HDD) clustering. The problem of the subspace clustering is modelled as a graph problem which has to retain the critical features from the N-dimension while applying a dimension reduction technique to maintain a higher accuracy and lower computational overhead trade-off. Most of the traditional approaches suffer from the efficiency degradation when applied to HDD. An optimisation of sub-space clustering is proposed in this paper for learning models using Laplacian graph on a HDD. The proposed model addresses the curse of dimensionality problem through Laplacian matrix function to minimise the data redundancy within sub-space. The traditional K-nearest neighbour (KNN) algorithm is improvised for the non-linear classification of subspace clustering on HDD clinical importance. The proposed system offers significant increment of 99% of accuracy in clustering operation.

Keywords

subspace clustering, high dimensional data, dimensionality reduction, curse of dimensionality, Laplacian graph, graph partition problem, KNN algorithm
