Q. No	Details of the Answer	Marks Distribution	Total marks
1	<p>What is a query language in the context of information retrieval? Briefly discuss the key components of a query language for information retrieval systems.</p> <ul style="list-style-type: none">• Text retrieval systems can answer various types of queries depending on the retrieval model adopted.• Full-text systems may not answer the same queries as those based on keyword ranking or hypertext models.• Some query languages are not intended for final users and can be used by higher-level software packages to query databases or CD-ROM archives.• Most query languages use content and syntax to find relevant documents, but may fail to find relevant answers. Techniques to enhance query usefulness include expanding words to synonyms, using a thesaurus, and removing stopwords.• The retrieval unit, which can be a file, document, web page, paragraph, or other structural unit, is another aspect of the system's approach. 2.	<p>Illustrate Word Sense Disambiguation (WSD)? With an example, explain the various techniques to handle WSD</p> <p>Word Sense Disambiguation (WSD) is the process of determining the correct meaning or sense of a word based on the context in which it appears. In the context of Information Retrieval (IR), WSD is important because it helps improve the accuracy of search results by ensuring that the retrieved documents are relevant to the user's query.</p> <ul style="list-style-type: none"> • Machine Translation • Information Retrieval (IR) • Text Mining and Information Extraction (IE) • Lexicography - WSD 	<p>Definition 2 marks</p> <p>Explanation 8 marks</p>	<p>10 marks</p>
3.	<p>Explain i) 4 types of keyword-based querying ii) Single-word queries, context queries, and Boolean queries with examples</p> <p>Single-word queries</p> <p>Text retrieval systems typically search for words, which are long sequences of letters. Most models allow us to view text in this perspective and search words, with some models also allowing for internal division into letters.</p> <p>The set of words retrieved can be used for word-treating purposes, such as thesaurus expansion or ranking purposes. Words carry significant meaning in natural language, so many models are structured around words.</p> <p>Word queries result in documents containing at least one word of the query, and ranked based on similarity to the query. Common statistics on word occurrences are used to support ranking.</p> <p>Context queries</p> <p>Phrase is a sequence of single-word queries. An occurrence of the phrase is a sequence of words. For instance, it is possible to search for the word 'enhance,' and then for the word 'retrieval.'</p>	<p>Each 2 marks and Examples 2 marks</p>	<p>10 marks</p>

	<p>Boolean queries The oldest (and still heavily used) form of combining keyword queries is to use Boolean operators. A Boolean query has a syntax composed of atoms (i.e., basic queries) that retrieve documents, and of Boolean operators that work on their operands (which are sets of documents) and deliver sets of documents.</p> <p>Explain the three uses of user relevance feedback and differentiate between Global and local analysis.</p>

6. Explain Query expansion system reweighting for the vector model & term reweighting for the probability model.

, D_r : set of **relevant** documents, as identified by the user, among the retrieved documents;
 D_n : set of **non-relevant** documents among the retrieved documents; C_r : set of relevant documents among all documents in the collection;
 $|D_r|$, $|D_n|$, $|C_r|$: number of documents in the sets D_r , D_n , C_r respectively;
 α , β , γ : tuning constants.
 Consider first the unrealistic situation in which the complete set C_r of relevant documents to a given query q is known in advance.

Standard-Rocchio: $\bar{q}_m = \alpha \bar{q} + \frac{\beta}{|D_r|} \sum_{\forall \bar{d}_j \in D_r} \bar{d}_j - \frac{\gamma}{|D_n|} \sum_{\forall \bar{d}_j \in D_n} \bar{d}_j$

Document Preprocessing

Document preprocessing is a procedure which can be divided mainly into five text operations (or transformations) (as shown in figure 2):

1. Lexical analysis
2. Elimination of stop words.
3. Stemming of the remaining
4. Selection of index terms
5. Construction of term categorization

8. Explain brief about Query expansion based on similarity thesaurus and explain pattern-matching words, prefixes, suffixes, substrings, and regular expressions.

Pattern Matching:

- Words
- Prefixes
- Suffixes A string which must form the termination of a text word. For instance, given the suffix 'tars' all the documents containing words such as 'computers,' testers, painters,' etc. are retrieved.
- Substrings
- Ranges
- Regular expressions some text retrieval systems allow searching for regular expressions.

Skandan

Index is a data structure built from the text to speed up the searches.

In the context of an information retrieval system that uses an **index**, the efficiency of the system can be measured

- Indexing time
- Indexing space:
- Index storage:
- Query latency:
Query throughput:

The **space required** for the vocabulary is rather small Heaps' law: the **vocabulary** grows as $O(n^\beta)$, where

- ☐ **n** is the collection size.
- ☐ **β** is a collection-dependent

The **occurrences** demand much more space the extra space will be $O(n)$ and is around.
